

v0.1.0

SMART HOSPITALITY MANAGEMENT SYSTEM

AI-assisted Windows desktop PMS for hotels, boutique hotels, guest houses, apart-hotels and resorts

Sell Right. Measure Right. Protect the Data.

Windows desktop (.exe)

100% local AI option

Encrypted identity data

Turkish / English

Version 0.1.0 · August 2026 · MIT license · Legal compliance remains the operator's responsibility

The Program in Numbers

60

Database tables · 56 ORM models ·
versioned with Alembic

1075

Collected tests — all run without network
access; that rule is itself tested

77.6%

Branch coverage — taken from ``pytest --
cov=app --cov-branch``

72

Permissions · 7 default roles · checked in
two separate layers

13

Critical scenarios — overlap, no-show,
quota, malformed JSON

5

AI providers: LM Studio · OpenAI · NVIDIA ·
Anthropic · Mock

14

Application screens in this deck — all
captured on fictional demo data

0

High-severity bandit findings · medium: 0 ·
low: 9

None of these numbers was typed in: ``sunum/olcum.py`` measures them from the source as the deck is built (19 August 2026). What cannot be measured prints as "not measured", never as a remembered figure.

Who It Is For — and What It Is Not

The program runs on a single property's own computer: it is not a cloud subscription, not a channel manager, not an accounting suite.

Target Property

Hotels, boutique hotels, guest houses, aparthotels and resorts with 5–150 rooms. Runs on one machine or a small local network; an internet connection is not required.

What It Covers

The complete front-office cycle from booking to departure: sales, stay, folio, payment, housekeeping, maintenance and management reports.

What It Is Not

Not a channel manager, not a POS, not accounting software. Turkish e-invoice and police-notification integrations are NOT DONE: the data model exists, the connection does not.

Where Responsibility Sits

The software makes data processing easier; compliance with data protection, e-invoicing and guest-notification obligations remains entirely with the operating business.

A Day in Four Screens

The day starts on the dashboard, runs through the front desk and the housekeeping and maintenance teams, and ends with night audit.

Dashboard

Occupancy, ADR, RevPAR and ALOS tiles; critical alerts (overdue departures, open faults, low stock) and a 14-day occupancy curve, all on one screen.

Reservations

Calendar, group bookings, waiting list, channel-tagged records. Night-by-night pricing and overlap prevention run at save time.

Front Desk

Check-in, room card, companions, folio, extra charges, payment and check-out. Early check-in and late check-out are charged in slots.

Housekeeping & Maintenance

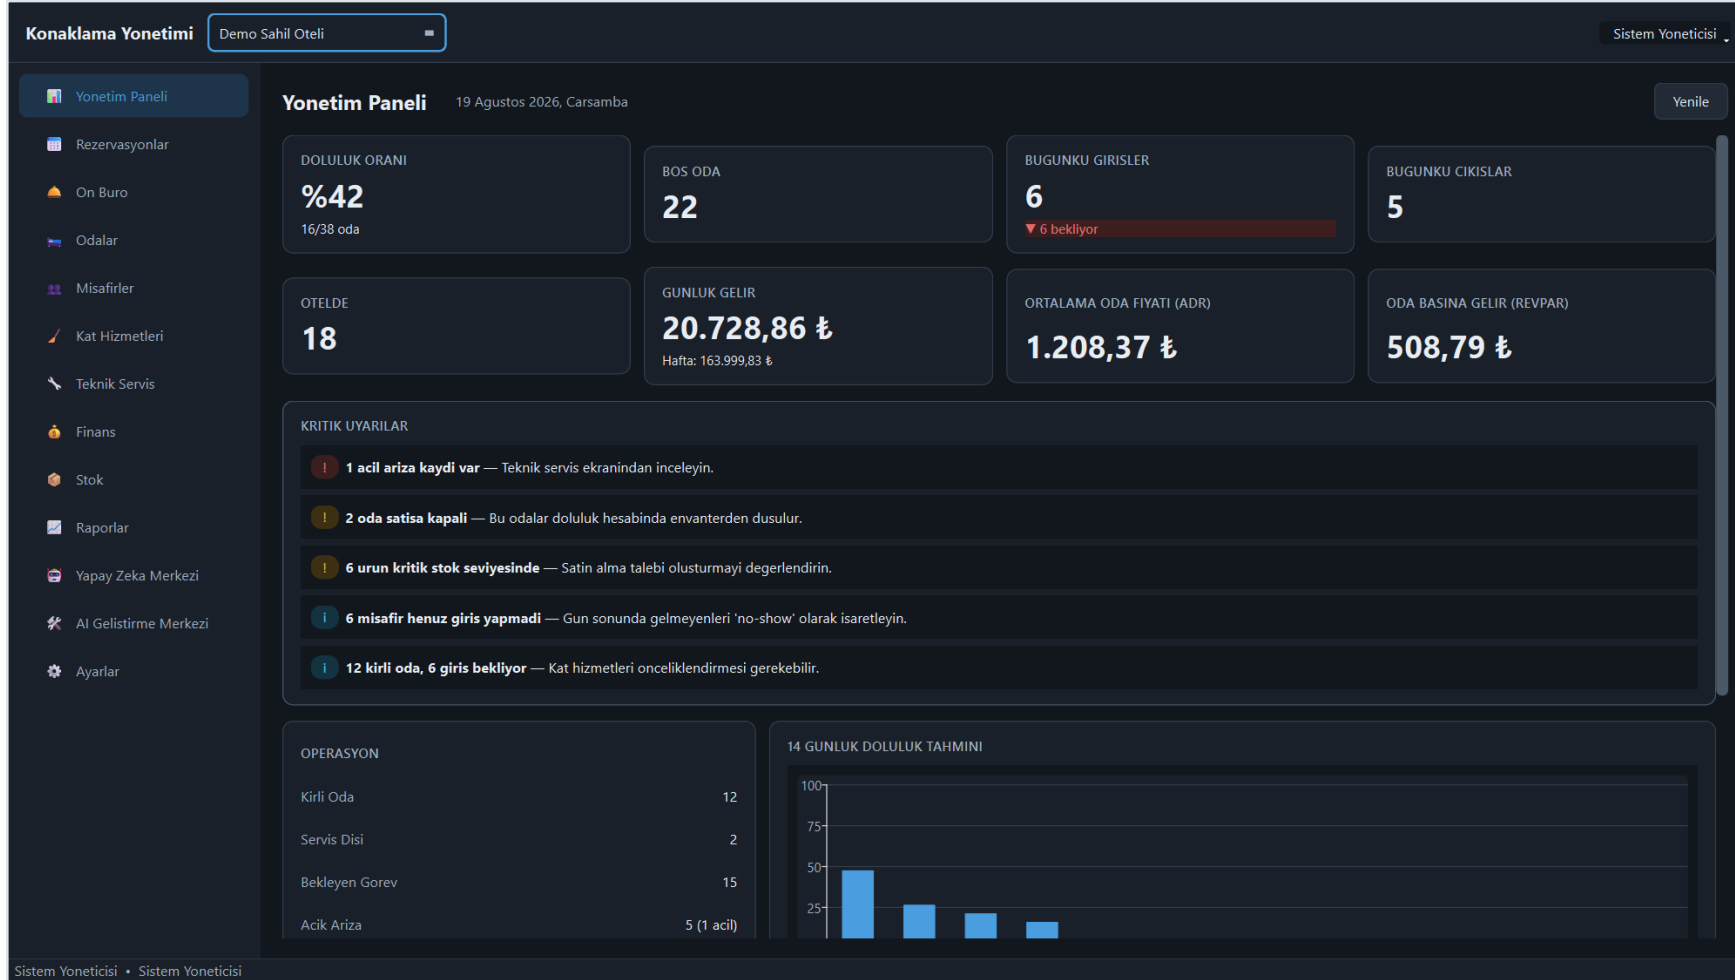

Daily cleaning tasks are generated and assigned; a fault record can take a room out of sale — a blocked room cannot be booked.

Shortcuts: Ctrl+1 Dashboard · Ctrl+2 Reservations · Ctrl+3 Front Desk · Ctrl+4 Rooms · Ctrl+5 Guests · Ctrl+R Reports

On Screen: The Dashboard

Occupancy, vacant rooms, daily revenue, ADR and RevPAR tiles; critical alerts and a 14-day occupancy forecast — the day starts on a single screen.

This and the following screenshots are taken from the program itself; all of the data is synthetic demo content with no real personal data.

On Screen: The Front Desk

Pending arrivals and departures, in-house guests and the uncollected folio balance on one screen; check-in starts from the list with a single button.

The Same Room Cannot Be Sold Twice

Overlap prevention is not a warning but a two-layer constraint: the application check and the database constraint enforce the same rule independently.

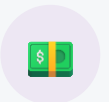

Two-Stage Check

First the application layer queries availability and produces a readable error; at write time the database constraint applies the same rule again. In a race, the second transaction is rejected.

Half-Open Interval

Dates are modelled as [arrival, departure): the departure day is not a night, so the room can be sold again the same day. Most overlap bugs are born exactly at this boundary.

Night-by-Night Pricing

Season rate, weekend uplift, extra person, discount and tax are computed for each night separately; no single average rate is multiplied by the stay length.

State Machine

Draft → confirmed → checked-in → checked-out; cancellation and no-show are separate paths. Invalid transitions are rejected and fee rules depend on the state.

99 domain tests cover this layer alone: availability 24, pricing 23, state machine 18, money and date value objects 34.

On Screen: Reservations

Search with status and date filters; confirmation number, nights, amount and balance in one list. Cancelled and optional bookings are colour-coded.

Folio — Never Deleted, Only Voided with a Reason

In financial records, correcting is not deleting. The program never removes a charge line; it voids it with a reason and the audit trail survives.

The Trail Survives

A mistaken charge line is voided and its reason recorded. The night audit total and the history therefore stay explainable at any later date.

Payments and Refunds

Cash, card and transfer payments; refunds, deposits and damage records. The balance is derived from the folio; an inconsistent amount is rejected.

Early In / Late Out

Charged in slots: a 4-hour late check-out is two slots and equals 50% of the nightly rate. The rule is pinned down by a test.

Night Audit

Arrivals, departures, in-house guests and cash movements are collected in the night audit report and exported as PDF, Excel or CSV.

There is no separate Finance screen yet: payments and folio work happen on the Front Desk, financial summaries under Reports.

Identity Data Stays Encrypted — and Searchable

You cannot search an encrypted column. The program resolves that dilemma with a blind index: the data stays encrypted, the search runs over a keyed digest.

Field-Level Encryption

National ID and passport numbers are written to the database encrypted. Verified with a raw SQL query: the column shows no readable number.

Blind Index

Search runs on an HMAC-SHA256 digest of the number: exact match works, the value is never exposed. Partial search is deliberately unsupported.

Unmasking Is a Separate Right

Seeing the unmasked number is a separate permission; not every user who can view the record holds it, and each unmasking is written to the audit log.

Guest CRM

Profile, stay history, preferences, VIP and blacklist, consent records. The summary currently counts only the primary guest; companion nights are excluded.

API keys, e-mail addresses, phone, ID and card numbers are masked automatically in logs; the masking is protected by its own test.

On Screen: Guest Profile and Privacy

The ID number is stored encrypted and displayed masked; the 'Show' button writes every reveal to the audit log with the user name and a timestamp.

Measurement — Hotel Metrics

Occupancy, ADR, RevPAR and ALOS come from one query layer: the number on screen and the number in the report are produced by the same code.

KPIs and Alerts

Occupancy, ADR, RevPAR, ALOS, cancellation and no-show rates. Critical alerts sit at the top: overdue departures, open faults, low stock.

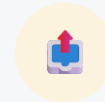

14-Day Occupancy

The next two weeks are drawn from confirmed reservations. This is not a demand-forecasting model but a projection of bookings already on the books.

Channel and Room Type

Revenue is split by channel (direct, agency, online) and by room type; what each channel actually brings in is visible in a single table.

PDF • Excel • CSV

Every report exports in three formats. CSV is written with a UTF-8 BOM so that Excel opens accented characters correctly.

106 reporting tests also cover export formats and the empty-data case: with no data the report does not crash, it renders empty.

On Screen: Reports

Occupancy, channel and room-type revenue, night audit, housekeeping and a KPI summary; every report can be exported to PDF, Excel and CSV.

The AI Advises — It Never Writes

The AI layer is the security boundary between the database and the model: no personal data leaves, and the model never changes a record on its own.

Prompt Screening

E-mail addresses, phone numbers and long digit strings are masked before the call; if any personal data remains after masking, the request is never sent.

Local Option

With LM Studio the model runs on your own machine: no cloud, no API bill, no data leaving the building. Cloud providers are optional.

Advice Only

Rate suggestions, guest-review sentiment analysis and message drafts are produced. None is applied automatically; the decision stays with the user.

Badge and Cost

Every output is marked with an "AI generated" badge; token count, duration and estimated cost are shown — free on a local model.

If the primary provider fails, fallback happens only on TRANSIENT errors. An invalid API key is permanent: it is reported, not hidden.

On Screen: The AI Center

Ready-made tasks and free-form questions; provider and model are chosen on the same screen. Every answer carries an 'AI-generated' badge.

AI Development Centre — A Restricted Sandbox

The AI can be given coding tasks; what it may do is bounded by a command policy, a sandbox and a quality chain.

Command Policy

Two layers: (1) an allow-list decides which command may run, (2) a target check decides which file it may touch. `.env``, key files and the guest database are closed to every reader, whichever one is used.

Sandbox and Diff

Writes happen only under the sandbox root; every change is shown as a diff first, nothing is written without approval, and lost-update protection is in place.

Git Guard

The task runs on its own branch, a checkpoint is taken before it starts, and failure rolls back automatically. Merging to main needs separate approval.

Quality Chain

Format → lint → types → tests → security. No change is committed until the tests pass, and the user cannot relax that rule.

187 tests cover this module. The layer that actually executes the command has low coverage; that gap is stated openly in the test report, with its measurement.

Security — Measured, Not Assumed

The security review is not a list of claims: each item rests on a test or on the output of a tool that was actually run.

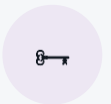

Authentication

Passwords are hashed with Argon2id; brute-force lockout, session timeout and a uniform error message that prevents user enumeration are in place.

Authorization Twice

Permissions are checked both in the UI (menu, buttons) and in the service layer. Hiding a screen is not enough; the unauthorized service call is rejected too.

Secret Handling

API keys live in Windows Credential Manager; they are never written to the database, the source or error messages. The repository was scanned for secrets.

Audit Log

Critical operations are written to an append-only audit log: who did what, when, and to which record.

bandit: 0 high, 0 medium and 9 low-severity findings — each low finding carries a written rationale. The numbers are measured as the deck is built.

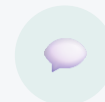

The Reviews Found Real Holes

The value of a security review is in what it finds. Everything below was fixed, each has a regression test, and the fixes are described in docs/SECURITY_REVIEW.md section 8.

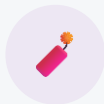

Missing Permission Check

Taking a room out of sale skipped the permission check: a user without maintenance rights could block a room. Closed; guarded by ``tests/application/test_operations_services.py``.

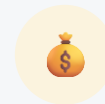

No Ownership Check

AI chat history did not verify ownership; one user could read another's conversation. Closed; guarded by ``tests/application/test_ai_service.py``.

Policy Bypasses

Bypasses were found in the command policy and closed. The last one came out of an independent pre-release review: an allow-listed reader (``head``, ``findstr``) could read ``.env`` with no approval. The decision now looks at the file touched, not at the command's name.

Financial Inconsistency

Arithmetic errors in folio and payment handling were corrected, and a key error being swallowed during provider fallback was fixed. Money never travels as ``float``, only as ``Decimal`` — and that is tested.

No commit hashes are cited on purpose: the evidence for a fix is the test that guards it. The same document lists what was not fixed — the number generators are not concurrency-safe.

The Numbers Were Run, Not Remembered

1075 tests pass and none of them touches the network — and that fact is itself protected by a test. The figure was measured while this deck was generated.

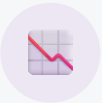

Layer by Layer

Domain 99 · security 75 · infrastructure 145 · application 158 · AI 123 · UI 182 · reporting 106 · development centre 187.

13 Critical Scenarios

Overlapping booking, cancellation, no-show, early arrival, blocked room, wrong payment, unauthorized access, dead model, quota, invalid key, malformed JSON, empty report — all covered.

Gaps Written Down

The startup path (login screen, main window) and the CLI stay uncovered; backup has low coverage. None of this is hidden — it is listed with its measurements and explained in docs/TEST_REPORT.md.

CI on Every Push

GitHub Actions (.github/workflows/ci.yml): format, lint, types, tests, security scanning, migration consistency and a "did a sensitive file enter the repo" gate. `ruff check app tests` currently reports 0 findings.

The report is a snapshot: 19 August 2026, version 0.1.0, Windows 11, Python 3.11. The numbers are measured at generation time and change when the code does.

Architecture — Dependencies Flow One Way

ui → application → domain ← infrastructure. The business rules know neither the database nor the UI, which is why the 99 domain tests run in seconds.

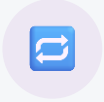

Framework-Free Domain

The domain layer imports neither the ORM nor the UI toolkit. The rule is not only documented but enforced by an import test.

Timezone-Aware

A custom column type stores every timestamp in UTC. Offset and daylight-saving bugs are solved in one place instead of scattered through the data layer.

Migratable Schema

60 tables are versioned with Alembic and CI verifies schema/migration consistency on every change. Enumerations are stored as text, not as integers.

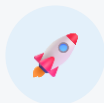

Page Registry

Adding a screen does not touch the main window: one line is added to the registry. Unfinished screens are declared in the same place.

Setup, Backup and Packaging

One command to install, one to back up, one to package. The database and logs live next to the application, so the installation stays portable.

One-Command Setup

The setup script validates the Python version, creates the virtual environment, writes .env with a random session key, applies migrations and creates the admin account.

Consistent Backup

The SQLite backup uses VACUUM INTO; copying the file in WAL mode produces an inconsistent backup. The current database is kept aside before any restore.

Windows Package

The build script produces an .exe with PyInstaller; on first launch a wizard prepares the database and shows the admin password once.

Maintenance Commands

bootstrap · seed-demo · backup · restore · check-ai · doctor. check-ai tests the provider connection, doctor the health of the installation.

A demo installation ships five role accounts (manager, front desk, housekeeping, maintenance, accounting). In a real deployment demo data and accounts must be removed.

What Is Not Done — Stated Just as Clearly

If a feature is on the roadmap, it means it should not be used in production today. The program does not hide its gaps from the user.

e-Invoice and Notification

NOT DONE. The invoice table has the fields and the settings file the keys; the authority integration, XML generation and notification flow do not exist.

Finance · Stock · Staff

Business logic and reports exist, dedicated screens do not. Opening one shows what is planned and how to do the same job today.

Number Generator

Reservation and folio numbers are produced with `max()+1`; under concurrent use the second write is rejected and must be retried. The fix lands in v0.2.

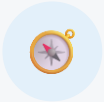

Cloud Providers

The NVIDIA and Anthropic adapters are written but never exercised against the real API — that needs a key. LM Studio was verified with a real request.

Document question-answering (RAG) and visual document analysis are also unfinished: the data model exists, the workflow is not wired.

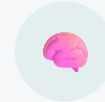

Roadmap

The order is deliberate: first the screens that complete daily operations, then depth in AI, and regulatory integrations last.

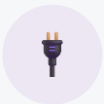

v0.2 — Operations

Finance, stock and room-type/rate-plan screens; staff and shift management; the concurrency fix for number generation; a group booking interface.

v0.3 — Artificial Intelligence

Completing the document indexing flow, visual document analysis (with a data-protection assessment), demand forecasting and dynamic rate suggestions.

v0.4 — Integrations

The e-invoice integrator connection, guest notification, a channel manager draft and the e-mail/SMS notification layer.

v1.0 — Production

PostgreSQL production setup, multi-property testing, an independent security audit, performance testing with 10,000+ reservations and user acceptance tests.

Most open to contribution: regulatory integrations, workflow feedback from real hotels, and the English interface translation.

RUN THE HOUSE KNOWING WHAT YOU SOLD

60 tables · 1075 tests · 77.6% coverage · encrypted identity data · a local AI option

A program that writes down its gaps too.
